

## CORISECIO - Mobile Suite

*Mobile Suite - more than just Device Management*

CORISECIO – Mobile Suite is the well proven security solution for the use of mobile devices in enterprises. IT administrators get a product for efficient and easy Smartphone configuration and installation. With only a few mouse clicks – from a central console – individually for thousands of users.

End users receive a configured and safe device in just three steps.

1. *Unpack factory-new device*
2. *Plug in and switch on device – installation and configuration are carried out automatically*
3. *Use device – all done within just a few minutes!*

Basis is the CORISECIO securityRunTime as secure environment with integrated Device Management. Protected against deinstallation and manipulation it allows for the secure enforcement of configuration- and security settings. Further more there are roll-out and helpdesk functions already integrated. The administration of all mobile devices is done intuitively via one central administration. The end user receives all software installed and all configurations set on his device. Safe access to the company network, email, WLAN and much more may be used by the end user immediately and synchronisation with the in-house Exchange Server may be configured permanently. Backup and Recovery functions offer a hard reset feature. The complete software and configuration settings may be restored automatically. The user only inserts his SD card and the device is ready for use in no time at all.

### REMOTE CONFIGURATION

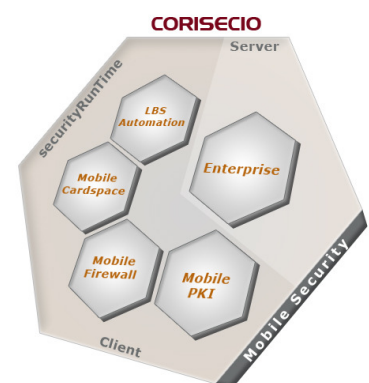

The securityRunTime does the installation of all devices used within the company and offers additional remote configuration capabilities for Windows Mobile Applications. Based on the configuration profiles, companies are able to configure thousands of mobile devices with just one mouse click. Workflows for roll-out assist administrators on installing the devices per mouse click. The administrator may choose installation via CAB files, Desktop Installer or SD cards. The Enterprise Extension also provides Over-the-Air (OTA) installations on basis of email or Web Portals. Installation is done fully-automated without user interaction.

### FACTS

- Remote administration of mobile users
- Device Management
- (OTA-) Roll-out of mobile devices
- Device Configuration (network, WLAN, email etc.)
- User Rights & interfaces and synchronisation control
- Automatic certificate management for S/Mime email, VPN etc.
- Automatic Backup & Recovery

### BENEFITS

- Efficient administration via central management of mobile devices
- Fast ROI
- Increased security level
- Decreased risk
- Higher efficiency
- Improved usability
- Decreasing help desk costs
- Reduced administration effort
- Higher availability

## MOBILE FIREWALL

Mobile Firewall protects the device configuration and controls risky interfaces. So companies receive a complete safety kit for mobile devices. User rights for setting changes, rules for use of Bluetooth- and WLAN adapters, IrDa interfaces and digital cameras may be realized up to driver level. Risks of an unwanted synchronisation may be solved easily with Mobile Firewall. The authorisation is verified during connection build-up. Synchronisation with unwanted devices e.g. with the private PC is prohibited. Furthermore pre-defined internet connections, access points, VPN tunnel and Proxy Server protect the business critical infrastructure. To enhance usability unused and blocked program- and setting-icons can be removed easily.

## LBS AUTOMATION

LBS Automation adds location based services to CORISECIO – Mobile Suite. On basis of geo positioning data the location dependent behaviour of the mobile device is automated. Location based the complete Smartphone may be reconfigured automatically. LBS Automation is integrated completely in the securityRunTime and provides companies to enforce location dependent device configuration and security settings.

## MOBILE PKI

With the Mobile PKI solution certificates may be used safely and easily for (Push)-E-Mail, VPN connections and even for the device log-in. So customers get a certificate based Single Sign-On for all security-relevant authentications like VPN or E-mail. Central certification management administrates certificates for mobile users and enables easiest use of PKI for mobile devices. Furthermore CORISECIO enhances the Microsoft File Encryption (EFS). Contrary to the standard Microsoft solution encrypted contents may also be used after a hard reset. Additionally the key store may be bounded to the hardware (device, SD or SIM card). So a security level similar to Smart Cards is achieved.

## ENTERPRISE-READY

The Enterprise Edition adds administration of mobile users, rights and certificates to the Mobile Suite. Import and synchronisation with in-house LDAP directories for user administration is as easily done as the integration of external CA and Trust Centres. For roll-out OTA workflows are available which allow a worldwide distribution of software, certificates and configurations.

## KEY FEATURES

### ■ secRT (Basis component)

- Remote configuration\*
- Profile management
- Roll-out mechanisms

### ■ Mobile Firewall\*

- User rights
- Rules for use of interfaces, applications and features
- Enforcement of Synchronisation rights
- Reduction of complexity
- Usability

### ■ Mobile PKI

- Import and use of certificates
- Single-Sign On\*, File encryption\*
- Email encryption & VPN connections\*

### ■ LBS Automation\*

- Location based services
- Location dependent behaviour of the mobile device

### ■ Enterprise

- User, rights & roles management
- Integration of existing Meta Directories, Trust Centre and CA (optional)
- OTA – Roll-Out e. g. via company portal

\* Windows Mobile only
