

# **CORISECIO - Portal Security (DLP)**

*Data Leakage Prevention for Enterprises*

Theft of sensitive information and documents is increasing further and companies are forced to especially focus on internal safety measures. Even when using portals complete solutions are needed to prevent theft and misuse of sensitive information.

CORISECIO integrates Data Leakage Prevention (DLP) solutions into the SAP Portal and protects companies against misuse and theft of sensitive data. DLP solutions scan documents and reliably block sensitive information and unwanted contents. On basis of internal corporate policies manipulation, sending and duplicating of data may be prevented. Besides the document text the solution also scans hidden meta data and additionally provides the possibility to create tamper-resistant pdf documents. The solution is easily to be integrated into leading office applications like Microsoft Office, Lotus Notes, etc.

On basis of CORISECIO securityRunTime the use of DLP solutions for SAP and other enterprise applications is now possible for the first time. For the user all scans in a portal or in the SAP GUI are completely transparent and without modification of workflows. Existing applications do not have to be adjusted. To meet the companies' different requirements in the best possible way, CORISECIO provides different operating modes of the solution.

### **USE CASES**

The reliable scanning of the complete data stream may be done with the implementation before the portal (Streaming Mode). So companies gain control over all incoming and outgoing data – transparent, easy and high performing.

Direct embedding in SAP applications is possible via standard interfaces (Application Mode). There customer benefit of the seamless integration into all SAP applications (e. g. SAP GUI). With the parallelization of scan and transmission processes even high performance requirements may be met by using the On-Demand Mode.

### **SAP CERTIFICATION**

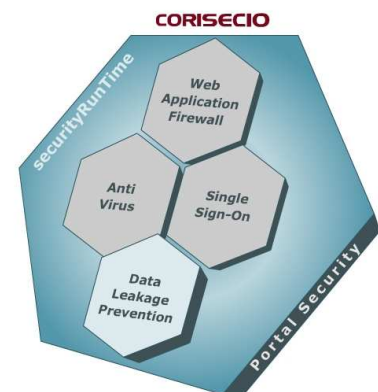

The solution package CORISECIO - Portal Security (DLP) is SAP certified. This guarantees the seamless integration into SAP products. So customers receive future proofness for SAP R/3 environments as well as for future SAP NetWeaver applications.

### **FACTS**

- Data Leakage Prevention for SAP applications
- Integration of DLP solutions in CO-RISECIO securityRunTime
- Supports SAP Standard interfaces
- DLP as SOA Security Service

### **BENEFITS**

- High protection of data in portals and applications
- Unchanged Workflows by seamless integration
- Low administration- and configuration need
- Low migration and license costs
- Future proofness
- High scalability

Nevertheless the Portal Security is no mere SAP solution but also protects portals and applications of other manufacturers as efficiently and reliably. The solution is based on the CORISECIO securityRunTime and supports leading Application Server and Portal applications.

### INSTALLATION & ADMINISTRATION

In the central administration CORISECIO provides the possibility to model dynamic Security Policies. So the behavior of the DLP services may be specified process dependant and realized automatically. Adjustments may be done during the runtime. The installation is completed within a few minutes and is supported by an intuitive user interface. All components may be installed by the administrators using (SAP) standard tools.

### PERFORMANCE

The CORISECIO solution runs completely scalable, an existing Load Balancer is used automatically. The CPU intense scan process may be done on a separate server and is easily scalable via additional CPU capacity. So the applications' performance is not affected.

### COMPREHENSIVE SECURITY

CORISECIO - Portal Security provides a complete security solution for portal protection. The solution bases on the CORISECIO securityRunTime and protects – besides portals – also SOA infrastructures. Data traffic is scanned in real time and connectable filters like e.g. WAF, AntiVirus and DLP repel threats before they even reach the portal or the applications. Furthermore CORISECIO provides a Single-Sign On which enables secure and easy access to portal and backend applications on user basis. All CORISECIO Portal Security components are SAP certified and so provide the most comprehensive protection for portals.

## KEY FEATURES

- Data Leakage Prevention for portals und web applications
- Integration in SAP Enterprise Portal and SAP GUI
- Web Service/SOAP/XML Support
- Operation Modes
  - Streaming (Transparent Proxy)
  - Application (SAP Standard interfaces)
  - On Demand (High Performance Implementation)
- Threat Notification configurable
- Central CORISECIO Security Administration

## PLATFORMS

- SAP NetWeaver - certified Integration
- IBM Websphere
- Microsoft
- BEA
- Oracle

**SAP®** Certified  
Integration with SAP NetWeaver®
